### Disclosures

We have no relevant financial disclosures

---

---

---

---

---

---

---

---

### Objectives

- Discuss creation and implementation of perioperative OSA patients at a single tertiary care center and spread to an enterprise
- Discuss lessons learned during this period
- Describe practice changes based on this process

---

---

---

---

---

---

---

---

### What was our Driving Factor?

- Mortalities as well as morbidities in practice and reported in literature presumed OSA-related
- How do we make our environment safer?
- What criteria do we use to assess patients?

---

---

---

---

---

---

---

---

### Next most important steps....

Anecdotes...

Data...

Department	Count	Percentage
General Surgery	15	15%
Orthopedics	12	12%
Cardiology	10	10%
Internal Medicine	8	8%
Neurology	7	7%
Emergency Medicine	6	6%
Urology	5	5%
Obstetrics/Gynecology	4	4%
Pediatrics	3	3%
Psychiatry	2	2%
Other	1	1%

---

---

---

---

---

---

---

---

---

---

---

---

---

**PAP naïve patient in perioperative period**

- We learned that nobody owned it...
- Patients don't like it
- Not innocuous
  - Bloating
  - Balancing competing priorities
  - Effect on sleep not certain
- Unlikely to be adherent without dedicated "team" approach and nearly direct supervision
- Reserve for very high risk with monitoring, or high risk with lots of attendance

---

---

---

---

---

---

---

---

“Dream Team”

- Increased variety of PAP interfaces
- Dedicated “expert” RT for fitting, education, introduction
- Close monitoring of adherence with feedback

---

---

---

---

---

---

---

---

PCA use....

Albert Bierstadt - The Wild West

---

---

---

---

---

---

---

---

Physician uses CPOE to place post-op orders, they are directed to the new PCA orders

Post-Operative Intravenous Patient-Controlled Analgesia (PCA) Allergies MUST be reviewed: [Additional Information](#)  
 (MC155-635m)

Orders apply to surgical patients (18 years of age and older). Doses based on normal renal and hepatic function.

**ALERT**  
 Order set NOT to be used if patient has received intrathecal opioid injection within 24 hours or has current epidural infusion running or receiving local anesthetic infusion. Consider avoiding Morphine for following patients: less than 50 kg, 70 years of age and older, or estimated CrCl less than or equal to 30 mL/minute.  
 Consider starting at Level 2 for patients less than 70 years and weighing greater than 50 kg.  
 Discontinue all IV, IM, or subcutaneous opioid orders except those contained within this order set.

### Mayo completes Epic transition with Arizona, Florida go-lives

Written by Julie Spitzer | October 09, 2018 | Print | Email

**Share** Rochester, Minn.-based Mayo Clinic completed its "Plummer Project," the name given to its systemwide rollout of a new Epic EHR, the health system confirmed Oct. 8.

**Post** The final three sites — Mayo's campuses in Jacksonville, Fla., and Phoenix and Scottsdale, Ariz. — went live on Epic Oct. 6, placing all Mayo locations on a single integrated EHR and revenue cycle management system. About 52,000 Mayo employees are using Epic in 90 hospitals and clinics throughout the health system.

Mayo Clinic began its transition to Epic at its Wisconsin locations in July 2017, followed by some of its Minnesota locations in November 2017. Its headquarters in Rochester, Minn., implemented the EHR in May.

"The commitment and expertise of outstanding Mayo staff, Epic colleagues and implementation partners brought us to this day," said Richard Gray, MD, co-chair of the initiative. "We envision even greater collaboration among experts in delivering the patient care, research and education that are hallmarks of Mayo."

Beckers Hospital Review Oct 9, 2018

### Paired Opioid + Narcan Utilization Rates

---

---

---

---

---

---

---

---

### Identify those at risk for deterioration OSA

---

---

---

---

---

---

---

---

---

---

---

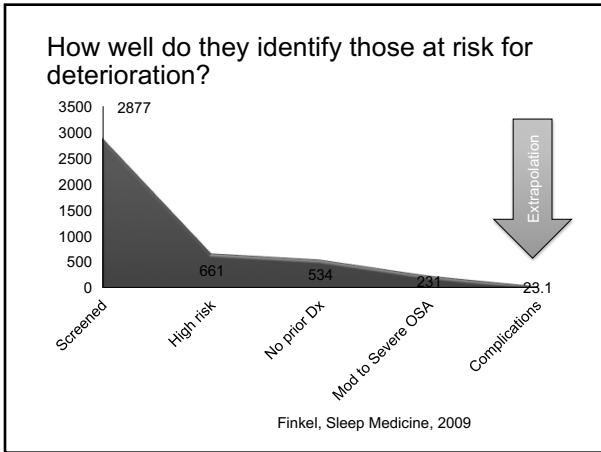

---

---

---

---

---

---

---

---

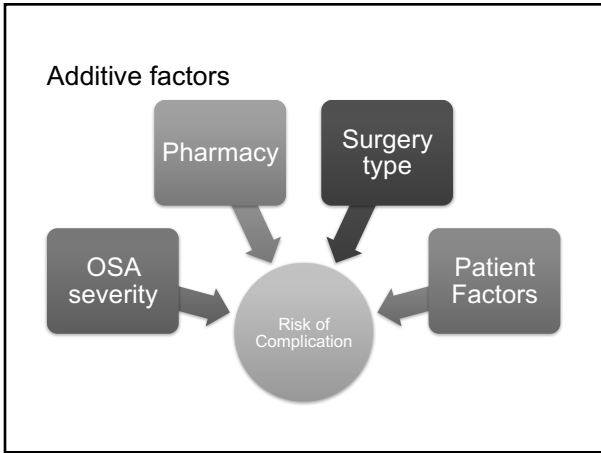

---

---

---

---

---

---

---

---

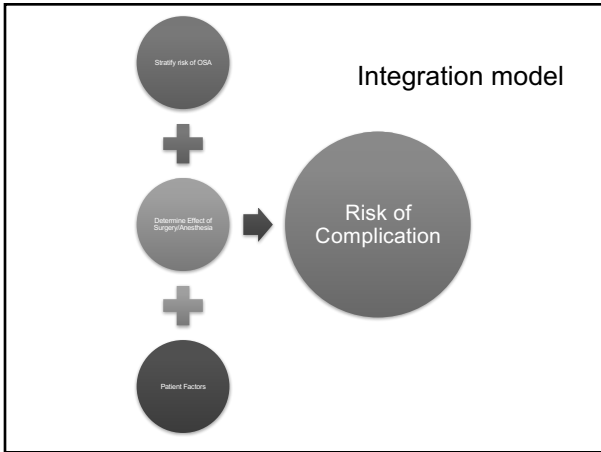

---

---

---

---

---

**Perioperative**

- How to identify patients
- What preoperative screening tool
- What changes in management

---

---

---

---

---

---

---

---

**Sleep Apnea Clinical Score**

1. Do you have high blood pressure or have you been told to take medication for high blood pressure?  Yes  No
2. People who have shared (or are sharing) my bedroom tell me that I snore. **Please pick the best response for the frequency of your snoring:**  
 Usually (3-5 times/week) [= 1 "Historical Feature"]  
 Always (every night) [= 1 "Historical Feature"]
3. I have been told by other people that I gasp, choke, or snort while sleeping. **Please pick the best response for the frequency of any of these symptoms:**  
 Usually (3-5 times/week) [= 1 "Historical Feature"]  
 Always (every night) [= 1 "Historical Feature"]
4. Neck measurement. (We will measure you.) \_\_\_\_ cm

**Prediction of OSA based on linear regression model utilizing above factors:**  
 Low = Sleep Apnea Clinical Score <15  
 High = Sleep Apnea Clinical Score ≥15

Flemons et al, Am J Resp Crit Care Med 1994;150:1279-1285

---

---

---

---

---

---

---

---

**PACU Evaluation**

	Evaluation Period		
	Initial	2 <sup>nd</sup>	3 <sup>rd</sup>
Bradypnea: < 8 respirations/minute (3 episodes needed for yes)	30 min. after extubation or PACU admit	30 min. after Initial eval. (60 min after extubation or PACU admit)	30 min. after 2 <sup>nd</sup> eval. (90 min after extubation or PACU admit)
Apnea: ≥ 10 seconds (only 1 episode needed for yes)	(whichever occurs later)		
Desaturations: Pulse Ox <90% with nasal cannula (3 episodes needed for yes)			
Pain/Sedation mismatch: RASS score -3 thru -5 <b>and</b> Pain scale score > 5 (only 1 episode needed for yes)			

RASS = Richmond Agitation-Sedation Scale Pain Score = Visual Analog Score  
 Recurrent events: if any event occurs at more than one eval period (not necessary to be same event)

---

---

---

---

---

---

---

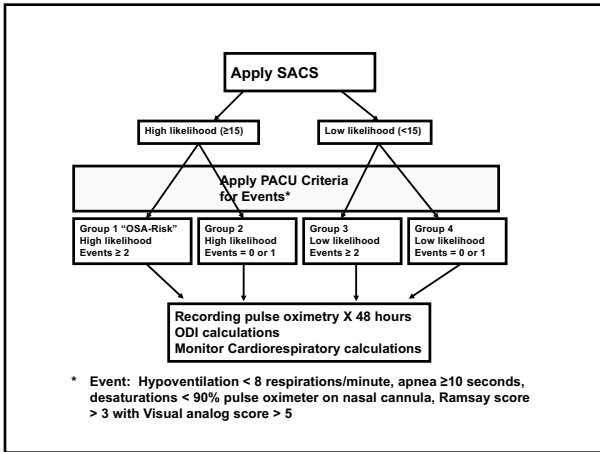

---

---

---

---

---

---

---

---

---

---

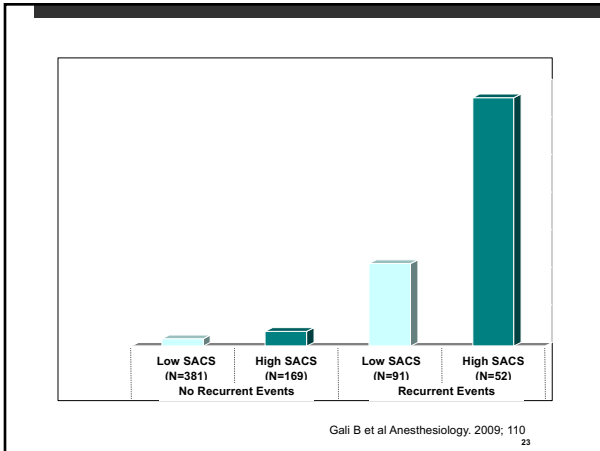

---

---

---

---

---

---

---

---

---

---

---

### Study Results

- Utilization of preoperative screening with SACS, and recurrent PACU respiratory events most useful
- Two phase process identified patients higher risk for perioperative respiratory desaturations and complications

Gali B et al Anesthesiology. 2009; 110

---

---

---

---

---

---

---

---

---

---

**Translation to Practice**

- Stepwise implementation
  - PACU assessments
  - Pre-operative screening
  - PACU nurse initiated protocol

---

---

---

---

---

---

---

---

**Stakeholders**

- PACU nursing
- Floor nursing
- Surgeons
- Anesthesiologists
- Sleep physicians

---

---

---

---

---

---

---

---

Obstructive Sleep Apnea	
Known OSA	No
High Blood Pressure	No
Frequency of Snoring	Occasional
Gasp/Choke/Snort	Never
Neck Measurement(cm)	35
OSA Total Score	1
Probability of OSA	Low

Obstructive Sleep Apnea (OSA) Clinical Score		<a href="#">Reference Link</a>
Known Obstructive Sleep Apnea?	No	2nd OSA Score   Clear OSA score
Does the patient have high blood pressure or have they been told to take medication for high blood pressure?	No	Total sleep apnea clinical score: 1
Has anyone who has shared (or is sharing) the patient's bedroom told them that they snore?	Occasional	OSA score pulled from MRC5 09-Jun-2016 07:10
Has the patient been told by other people that they gasp, choke, or snort while they are sleeping?	Never	Probability of Sleep Apnea
Neck measurement (cm)	35	Low: (Score < 15)   High: (Score > or = 15)

---

---

---

---

---

---

Anesthesia notified	AnesNotified	

---

---

---

---

---

---

---

---

---

---

**Implementation Issues**

- Adding work to preoperative process
- Education of involved care teams
- Adherence to protocol

---

---

---

---

---

---

---

---

---

---

**Automated Vs Manual Pulse Oximetry**

- 5 patient units
- Compared manual oximetry data to automated continuous oximetry
- Manual data higher oxygen saturations (6.5%)
- Continuous electronic monitoring more effective

Taenzer A et al. Anes Analg 2014;118:326-331

---

---

---

---

---

---

---

---

---

---

### Remotely monitored oximetry

- Limited availability
- Expand units
- Expand resources

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

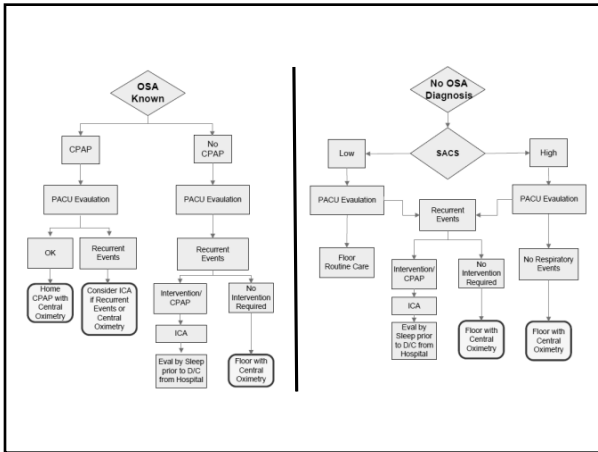

---

---

---

---

---

**Unanticipated Issues**

- Who would perform pre-screening
- Floor nursing
- Anesthesiologists

---

---

---

---

---

---

---

---

**MAYO CLINIC** *Remote Pulse Oximetry Monitoring*  
 Protocol applies to postoperative patients 18 years of age and older.

(Mayo Clinic Number, Name and Room Number Above)

**INCLUSION CRITERIA:**

- Patient at high-risk of obstructive sleep apnea (Obstructive Sleep Apnea Clinical Score greater than or equal to 15; Source: OSA Total Score within the Preoperative Checklist Flowsheet).
- Patient has had 2 or more positive respiratory specific assessment periods within the Post-Anesthesia Care Unit (PACU).
- Diagnosis of obstructive sleep apnea (Source: Preoperative Checklist Flowsheet).

If one or more boxes are checked, proceed to Exclusion Criteria Section. Otherwise, protocol does not apply.

**EXCLUSION CRITERION:**

- Patient admitted to either a progressive care unit (PCU) or intensive care unit (ICU) for the first 48 hours post-operatively. If box not checked, proceed to Intervention Section. Otherwise, protocol does not apply.

**INTERVENTION:**

**Note:** This protocol may be discontinued if the patient is discharged from the hospital before the 48 hours monitoring interval has expired.

- Initiate continuous pulse oximetry for 48 hours upon arrival on the patient care area. Continuous pulse oximetry may be suspended while patient is out of bed.

---

---

---

---

---

---

---

---

### How to Ensure Continuity

- Sleep physicians not available in hospital
- Inability to address need for follow-up on weekends
- Now pager/consult accessible

---

---

---

---

---

---

---

### Mayo Clinic practice sites

---

---

---

---

---

---

---

### Mayo Health System Healthcare in Minnesota, Iowa and Wisconsin

Almost 900 physicians in 70 communities

---

---

---

---

---

---

---

### What about Initiation of CPAP from preop assessment?

- High risk patients offered PAP preop
  - 431 referred, 211 underwent PSG
  - Mean adherence 2.5 hrs/night
- Low interest in pursuing PSG
- Low adherence

Guralnick AS et al. JCSM 2012;8(5):501-506

---

---

---

---

---

---

---

---

### Postoperative PAP Initiation

- High risk
  - Standard care vs initiation auto-titrating PAP (APAP):43 each group
  - No benefit in postoperative complications
  - Multiple obstacles to adherence
  - Poor enrollment

O'Gorman SM et al. Chest 2013;144(1):72-78

---

---

---

---

---

---

---

---

### Alternatives to PAP

- Nasal high flow therapy
  - Single blinded randomized
  - Recruitment preoperative clinic
  - Nasal high flow 30 LPM vs 1 LPM
  - 42 completed
  - ODI 4% higher in nasal high flow
    - Median 7.4 (IQR 3.5-13.3) vs 3.1 (IQR 1.5-6.7)

Selim B et al Chest 2018

---

---

---

---

---

---

---

---

### Assessing Impact

- Pre Implementation
  - 2003-2007
- Post Implementation
  - 2008
  - Stepwise changes following this
- Codes, RRTs, transfers to ICU

---

---

---

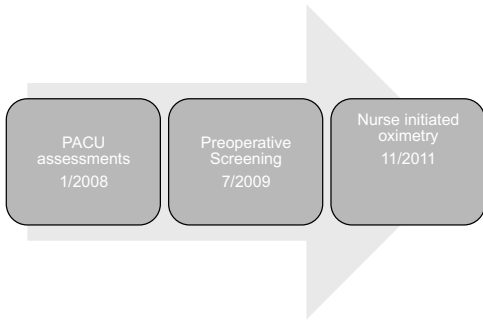

---

---

---

---

### Protocol Process

---

---

---

---

---

---

---

### What have we found?

- Retrospective
  - Patients high risk
    - Utilization of RRT
    - Admission to ICU from floor

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

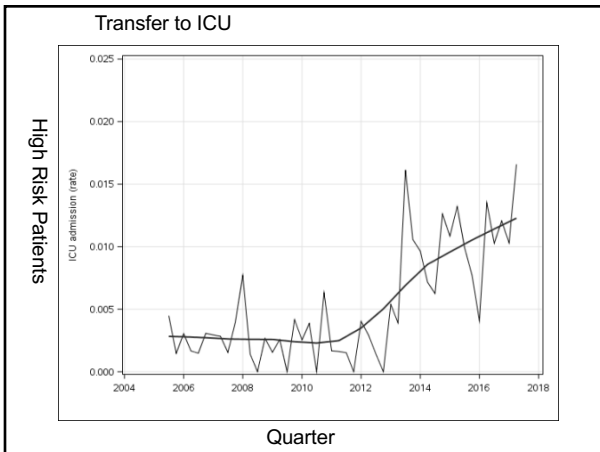

---

---

---

---

---

---

**Further Assessment of Initial Results**

- Did use of increased monitoring lead to increased RRT/ICU transfer?
- What is our success rate with use of CPAP?
- Has our education led to changes in views of perioperative management?

---

---

---

---

---

---

---

**Future Assessment**

- Is this cost effective?
- How well do we comply with protocols?
- What happens when patients are missed?
- Outcomes in high risk sedation areas

---

---

---

---

---

---

---
